Danir Kantserov

GIS & CAD mapping for wetland delineations and permits

Architecture student at Politecnico di Milano · GIS/CAD drafting in QGIS

You do the fieldwork. I produce the maps, exhibits and GIS files for your report.

No survey work; non-farm sites for now.

- Figure sets to your District's guidance: St. Paul District / BWSR (Minnesota sample) or the SPD Map and Drawing Standards 2016 (California sample)
- Location, topography, soils, NWI, flood and aerial figures and the final delineation, with the local wetland types (Circular 39 and Eggers & Reed in Minnesota)
- Impact exhibits (plan and cross-sections) and state permit sheets for the Water Boards (401) and CDFW (1602), from the same geometry (California sample)
- Shapefiles, a GeoPackage, a DXF and the ORM bulk-upload tables with every set

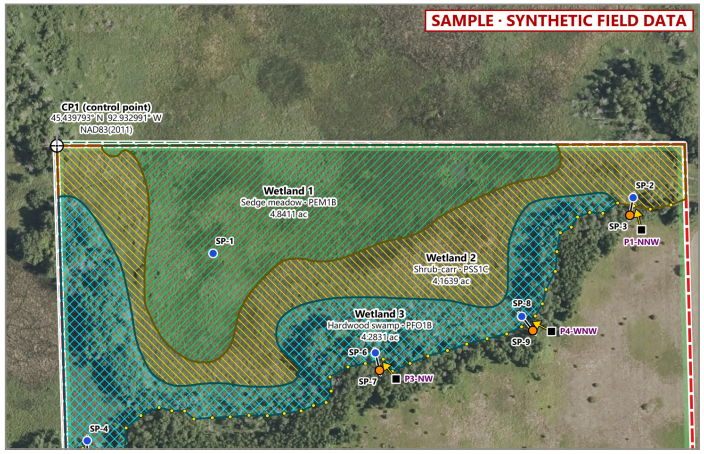

Price: from $150 per figure set, with a fixed quote and delivery date per job before work starts. First job: you pay only if you use the maps.

Free test: I have no paid delineation jobs yet, so send me one figure from a report you've already filed (a public one) and I'll redraw it in your format so you can compare. No obligation.

Corrections: one correction round for mapping issues, within 3 business days of your request, or by a date we agree if you ask in one of my deadline weeks. My liability is limited to the fee you paid.

Your data: used only for your job and deleted on request; NDA on request. I produce the figures with a scripted QGIS/Python pipeline that I run with an AI assistant (Anthropic's Claude, model training turned off), and I check every sheet myself before delivery.

Minnesota sample · sheet 8 · synthetic field data

Both samples use synthetic field data on real sites (Minnesota: inside the Carlos Avery Wildlife Management Area boundary; California: almost entirely under conservation easements) and make no wetland or jurisdictional finding; each cover states the land status in full.

What the samples contain

The California sample's DXF drawn on its own (no basemap, text layers hidden): delineation, project, impacts, CDFW extent (teal) and contours.

Map sets (vector PDF, 11 × 17)

California sample: 16 sheets, each with a north arrow, bar and text scale, a legend with areas, a latitude/longitude reference point and a reference block; aerials are date-stamped. Minnesota sample: 8 sheets.

GIS layers + metadata

California sample: 19 layers as shapefiles in state plane (US survey feet) and in WGS 84, plus a GeoPackage and an Esri file geodatabase; feature names as on the maps (WL1, VP1, STR1a); a metadata text file. Minnesota sample: 13 shapefile layers in state plane, a WGS 84 GeoPackage and a metadata text file.

ORM bulk-upload tables

California sample: the 11 Aquatic Resources columns and the 19 Impacts columns, as CSV files and an Excel workbook in that column layout (the Corps' upload workbook itself comes from your RRS account). Minnesota sample: the 11 Aquatic Resources columns as a CSV file.

CAD file (DXF)

AutoCAD 2013 DXF; read back without errors in the ODA File Converter (both samples). California sample: 42 layers with content (plus the standard 0 and Defpoints), nothing on layer 0, every area feature a closed polyline; California State Plane Zone 2 in US survey feet, so it lines up with a site plan in the same coordinate system. It holds all 19 GIS layers, feature for feature, and the contours. Minnesota sample: built to the same rules, 18 layers with content, in Minnesota state plane (US survey feet).

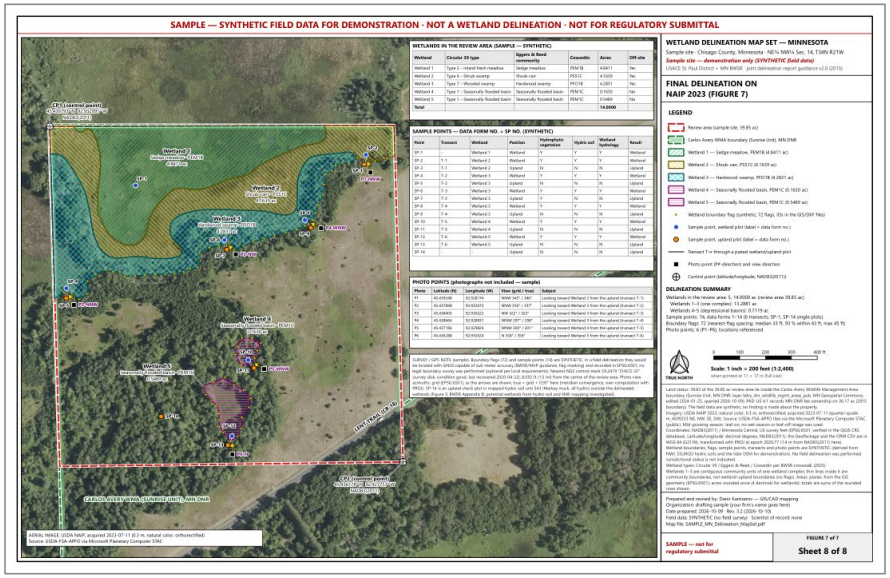

Quality checks

Every area, label and table row is checked against the GIS and the ORM table before delivery; QA summary on request.

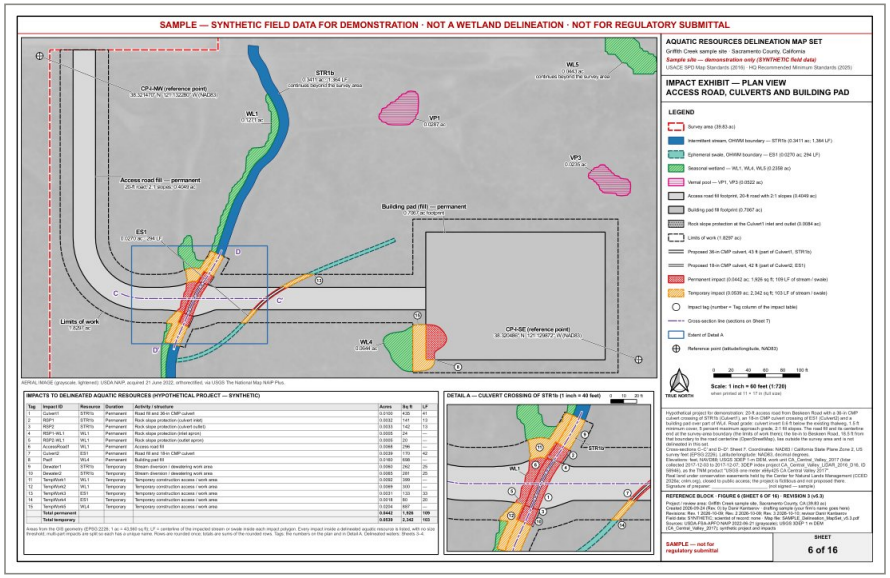

Available on request

California sample: the standards checklist listing each exception (SPD, HQ national, permit) and a QA summary. Minnesota sample: the BWSR / St. Paul District checklist.

Two sheets of the samples

Minnesota sample, Sheet 8: Figure 7, final delineation on the 2023 aerial (1 inch = 200 feet)

California sample, Sheet 6: impact exhibit, plan view, with the impact table

The same Sheet 8 also comes re-laid on one letter page with a client title strip and logo box, to show a figure in a report format.

What I need from you

Your GNSS exports (SHP, GDB, CSV or KML) and data-form IDs; for impact exhibits and permit sheets, also the project design (CAD or PDF) and the photos with their log (California permit sheets: also your CDFW extent).

Sample notes

The samples use synthetic field data on real sites. On real jobs, imagery dates, basemap and flood source follow your district's requirements. The standards checklist listing each exception is available on request.

Privacy (prospects). Danir Kantserov, Milan, is the controller. I use your firm's name and business email, taken from your public website, to offer this service: one introduction and one follow-up, on legitimate interest. Gmail (Google) and Claude (Anthropic), both in the US, process the messages. I keep the data until 31 Jan 2027 unless we start working together; a "no" goes on a do-not-contact list that I keep. You can object, ask for access or erasure, or complain to the Italian Garante: reply to my email.
